

Ausztria: Az elhízás előfordulása

Felnőttek, 2005-2006

Felmérés típusa:	Mért
Életkor:	30-74
Minta nagysága:	1054
Érintett terület:	Országos *

Referenciák: Schwarz B. Abdominal obesity and cardiometabolic risk factors in Austria. RdM O&G 2007; 3: 65- 96

Jegyzetek: * It should be made clear though that the author of the above survey noted that although the survey population was well balanced and fairly representative, as they were based in a primary care setting, selection bias towards higher morbidity risk could exist. In contrast though volunteers to health screening programs may lead to a selection bias the other way. The author could not determine which effect dominated.

Hacsak másként nem jelezzük, a túlsúly 25 kg és 29,9 kg/m² közötti BMI-re, az elhízás 30 kg/m²-nél nagyobb BMI-re utal..
